

JANUSMAIL & ZIMBRA

Janusmail can be integrated with all major mail systems, but it supports special advanced additions with Zimbra.

Zimbra users and administrators will benefit from simplified access and advanced security features. Zimbra system providers will be able to offer an advanced and fully integrated email security service.

DIRECT ACCESS TO THE DASHBOARD

Users can access the Janusmail dashboard directly from their Zimbra webmail. Authentication through cookies allows you to log in without having to enter your password each time when accessing from secure networks, while the integrated control systems on Zimbra allow you to manage authentication even on access stations shared between multiple users.

AUTOMATIC BLOCK OF VIOLATED BOXES

Janusmail intervenes directly on the Zimbra box and blocks its access once a violation has been detected, for example if the box is sending spam without the user's knowledge. This block prevents anyone who has breached the box from accessing and using it. Administrators can also unlock the box and change the password directly through the Janusmail console.

ADVANCED INTEGRATION

The Zimbra Advanced module includes very advanced security and management functions for Zimbra users.

AUTOMATIC REMOVAL OF SPAM FROM THE ENTIRE DOMAIN

It may happen that a spam email passes the checks and ends up in the inbox of multiple users. When the first user reports this email as spam, Janusmail moves it automatically in the "junk mail" folder of other users. This policy can be applied to a single domain or entire customer.

COMPLETE TRACKING OF THE E-MAIL ROUTE

Users and administrators have the possibility, from the management console, to verify not only the actual delivery of an email to the mail server, but also the delivery to the recipient's box.

They can also know what actions have been carried out on the email: deleting, forwarding, moving to a spam folder, downloading via pop / imap.

Finally, the dashboard reports any errors that prevent delivery of the email to the recipient, such as duplicate message-ids.

These LOGs are maintained, as per regulations, for 7 years.

Available, with many other services, inside the module

ADVANCED SECURITY

POST-DELIVERY THREAT REMOVAL

It can happen that emails containing URLs or unidentified malware pass checks.

Janusmail takes into account all the emails delivered.

The moment you identify them as dangerous, moves them to the "unwanted mail" box of the individual users, then reporting them also in the periodic report
